

Managing Security Operations entails the design, build, operation and ongoing growth of all facets of the security capability of the organization. An effective SOC has many moving parts and must be designed with the ability to adjust and work within the constraints of the organization.

Service 1 Open Source Log Management

Log storage and management are the fundamentals of security detection. We will help you with storing the logs from your system. Customised rules and reports will be created for monitoring.

Service 2 SIEM Assessment

This service provides you with an in depth assessment of your security operations against industry accepted practices. Guidance will be provided from a log management and security monitoring perspective along with recommendations for improvement.

Service 3 Security Analyst Training

We provide the necessary training to get your analysts to understand the weightage of their roles, provide them with the skills to detect security violations and perform security investigations.

Service 4 Resource Recruitment SOC

Sometimes you do not have the time to find the talent cause you are busy performing more important tasks. This service enables you to hire good cybersecurity talent for the security operations center within your time guidelines to ensure smooth operations.
